How will Brexit affect bugs across the continent?

The EU has been good for bugs with the Habitats Directive, EU Red Listing work, Water Framework Directive and Clean Beaches being good examples. The progress made over the last 20 years is likely to continue into the future.

On the other hand the record of the UK Government over the last 20 years on wildlife conservation has been less glowing. While the Government has tried to improve the environmental credentials of the Common Fisheries and Common Agriculture Policies, it is also characterised by repeated visits to the courts for failing to apply environmental protection measures and attempts to block environmentally sensible EU proposals. The UK took the lead (under several governments) on successfully blocking the proposed Soil Directive; has tried to block EU efforts to improve air quality; tried to block efforts to protect bees from neonicotinoid pesticides, and is blocking new pesticide safety measures that would check that candidate pesticides do not harm bumblebees or solitary bees.

Should the UK leave there remain a great many uncertainties about the exact relationship that the UK would have with the EU post Brexit and hence the exact impacts on invertebrates. Although when the UK joined the EU it was known as the <u>'dirty man of Europe'</u>, in the long term it is possible that the UK governments could become more responsible environmental custodians.

The list below focuses on the more predictable and higher impact issues, there are of course a great many issues that affect the conservation of bugs across the EU, the list also focuses more on the short term which is more predictable than the >20 year time horizon which is difficult to envisage.

Risks to Buglife Charitable Objectives	Charitable Objective Problem/Opportunity	Effect of Outcome	Likelihood of Outcome

EU's only international all wild pollinator
conservation charity (Buglife), Butterfly
Conservation, the Bumblebee Conservation
Trust and the only two national pollinator
strategies. The EU's ability to reverse
pollinator declines are better with the UK
participating fully in the democratic and
expert processes.
Achievement of good EU Water Framework Directive has been High Negative Possible
ecological status for slow to be implemented across the EU. In
freshwater bugs in the the UK legal challenges have ensured that
rest of the EU compliance is taken seriously, there
remains a significant risk that the UK will
fail to put in place appropriate measures in
most catchments. If this happens the UK is
likely to end up at the ECJ and there is a
high chance that the resulting ruling would
also push forward the implementation of
good ecological status in other Member
States. This possibility won't be realised if
the UK leaves before the issue is resolved.
Achievement of good Without directly applicable legislation and High Negative Likely
ecological status for recourse to the ECJ it seems unlikely that
freshwater bugs in the UK the UK will deliver good ecological status in
waterbodies.
Cross border trade in EU regulations have meant that the UK has Medium Likely
endangered species had to improve its legal framework for Negative
regulated effectively controlling the trade in EU species. It is
unclear how this might apply if the UK left,
it may be that the basic protections would
still apply, but any reduction in
coordination is likely to have a negative
effect.
